Engine Model
internal combustion engine in a small scale is one of the tougher projects you can take on in model engineering. As engines get smaller, tolerances must be tighter, and some things like the size of air and fuel molecules and electricity just don't scale.

to the development of internal combustion engines. In 1791, John Barber developed a turbine. In 1794 Thomas Mead patented a gas engine. Also in 1794 Robert Street patented an internal-combustion engine, which was also the first to use the liquid fuel (petroleum) and built an engine around that time.

Combustion

combustion engine (ICE), the ignition and combustion of the fuel occurs within the engine itself. The engine then partially converts the energy from the combustion to work. The engine consists of a fixed cylinder and a moving piston. The expanding combustion gases push the piston, which in turn rotates the crankshaft.
