### **Simplifying Algebraic Fractions | Questions and Revision | MME**

When solving equations containing algebraic fractions, first multiply both sides by a number/expression which removes the fractions. Example.

Solve  $10 - 2 = 1(x + 3)$

x. multiply both sides by  $x(x + 3)$ :  $\therefore 10x(x + 3) - 2x(x + 3) = x(x +$

**Algebraic Fractions -  
Mathematics GCSE  
Revision**

The first thing to do when simplifying an algebraic fraction is to simplify each part of the fraction. Start with the top part, factoring out as many numbers as you can. For an example, this section will use the problem:  
 $9x-3$   $15x+6$  Start with the numerator:  $9x - 3$ .

# Read PDF Simplifying Algebraic

There is a common factor to both  $9x$  and  $-3$ :  $3$ .

One way of demonstrating this is to divide out two equivalent fractions. For example  $\frac{3}{2}$  and  $\frac{6}{4}$  both result in a quotient of 1.5 when divided. By practicing simplifying fractions, students will hopefully recognize unsimplified fractions when they start adding, subtracting, multiplying and
