Spina Bifida Genetic And Developmental

Spina bifida is a complex condition that is likely caused by the interaction of multiple genetic and environmental factors. Some of these factors have been identified, but many remain unknown. Changes in dozens of genes in individuals with spina bifida and in those of their mothers may influence the risk of developing this type of neural tube defect.

Spina bifida is a birth defect in which there is incomplete closing of the spine and the membranes around the spinal cord during early development in pregnancy. There are three main types: spina bifida occulta, meningocele and myelomeningocele. The most common location is the lower back, but in rare cases it may be in the middle back or neck.

Spina bifida - Wikipedia

Spina bifida (Latin for “split spine”) is a type of neural tube defect, which is a problem with the spinal cord or the structures that cover it. The neural tube normally closes during the early weeks of embryo development, and can occur at any point along the spine (“backbone”). The spine normally protects the spinal cord.
